

SW7 No A0875

To improve uptake of plant protection products and foliar nutrients on crops that are difficult to achieve good coverage, with waxy or tight layers of leaves or dense canopies

Features and benefits

- Silicon based wetter
- Improved coverage of foliar nutrients
- Improved uptake of foliar nutrients
- No harvest interval
- Low rates required
- Supplies the important Si to the crop
- Increases transportation through the xylem when used in fertigation
- Alleviates abiotic and biotic stress
- Along with calcium, strengthens cell walls

Crops

Can be used on most crops

Useage

Use where good leaf coverage is required. Always consult the appropriate nutrient or plant protection product (PPP) guide before use. SW7 is suitable with both hard and soft water. Use 0.05-0.1% dilution in a minimum of 100 l/ha water. Use the higher rate on waxy leaves, dense canopies and mature crops.

Working with:

BHGS

SUPPLYING YOUR GROWING NEEDS

Directions For Use

- In programmes with pesticides to improve efficacy
- In mixes with nutrients to improve uptake
- 0.05 - 0.1% of spray volume = 0.5 to 1.0 ml per litre of water applied
- Do not apply SW7 to crops in flower when pollinators are active, or if beneficial predators have been introduced to the environment. As with any silicon wetter the reduction in surface tension of the spray may impact negatively on insect movement
- Avoid over application on sensitive plants
